Airflex By Danfoss Caliper Description

Section H

Caliper disc brakes are ideally suited for most large torque, high energy stopping applications. By proper choice of actuating pressure, number of calipers per disc, number of discs and disc diameter a braking system can be custom designed for most applications.

The calipers are of the opposed piston design. This design permits fixed mounting of the caliper and the brake disc. Symmetrical split construction of the piston housings permits a center reaction mounting and the ability to accommodate brake discs of different thicknesses. Friction shoes attach to the caliper actuating pistons and are replaceable without disturbing the caliper mounting. Pressurizing the piston cylinders causes the piston mounted friction shoes to clamp the disc, developing the braking torque.

Caliper model 225DP100 is designed with self adjusting retracting mechanisms which compensates for friction material wear and maintains a constant running clearance between the friction shoes and brake disc. They also maintain a constant displacement volume and hence a constant response time for each brake engagement.

Caliper model 200DPA is a symmetrical opposed piston caliper brake design that is well suited for most high torque, high energy stopping applications. Model HC-3 and HD-3 calipers are designed for very heavy duty braking service. The design automatically compensates for run out on large diameter brake discs. Because of this feature, they require manual adjustment to compensate for friction material wear and to maintain a constant volume displacement for actuation. Model HC-3 requires a mounting between the piston housings. Model HD-3 is used for side surface mounting.

Low coefficent friction shoes are available which permits the calipers to be used as tension brakes.

All three caliper models can be air or hydraulic actuated. The pressurizing media must be specified to insure proper piston seal compatibility.

Two seals are available: one for air and mineral base fluids, and the other for vegetable base fluids.

Maximum allowable operating pressure is 1000 psi (69 bar). For those installations not equipped with a high pressure power source, a pressure intensifier can be used to provide the required pressure. This device multiplies a low air pressure input into a high hydraulic pressure output.

Where used:

- Conveyors
- Flywheel Brakes
- Mining Equipment
- Railroad Maintenance Equipment
- Tension Brakes

Features:

Split construction
Accommodates discs of different thicknesses and diameters to meet a wide array of customer requirements.

Air or hydraulic operation
The DP and H calipers can be actuated with either air or hydraulic fluid to accommodate existing systems and provide a wide range of torque capabilities.

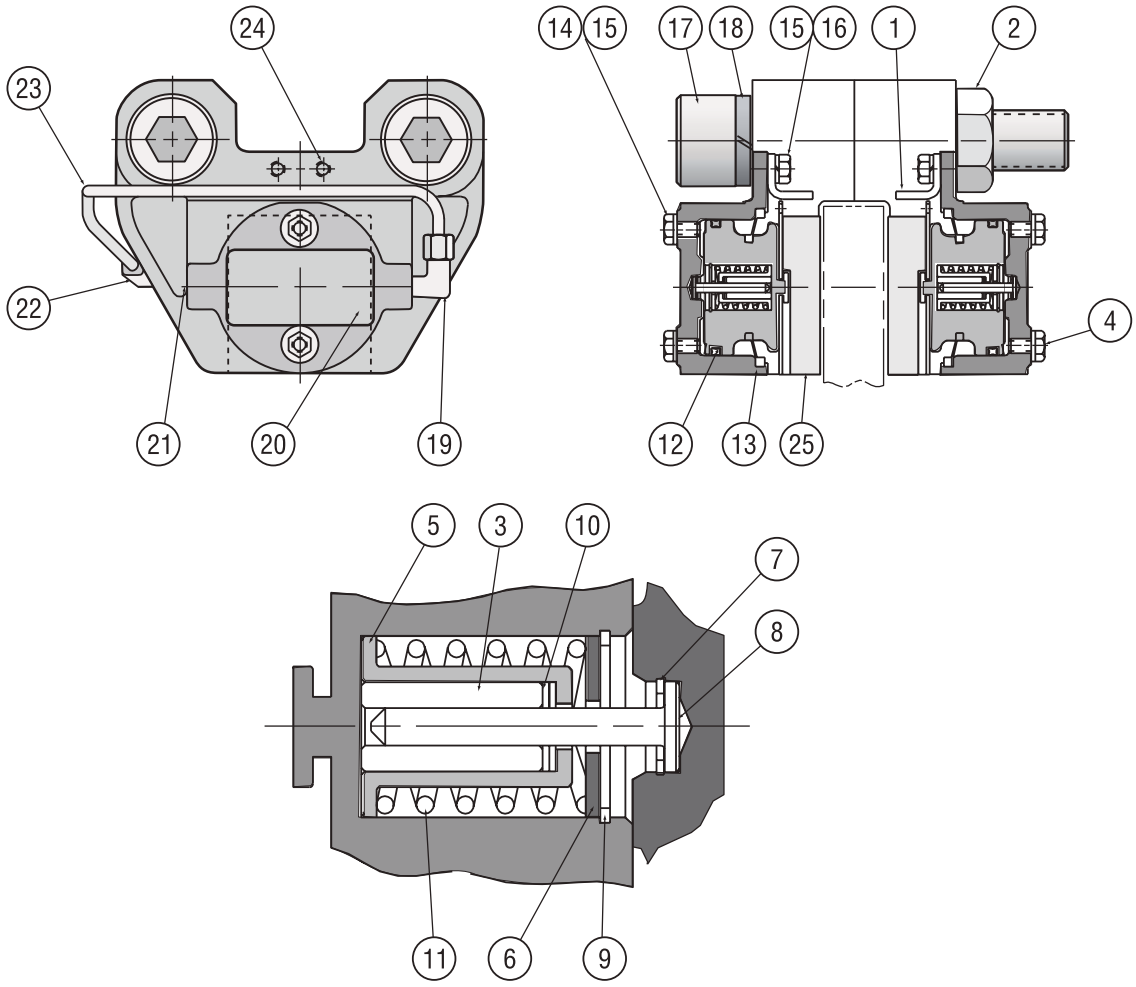

Large piston area
The large piston area coupled with high actuating pressure gives high braking torque.

Ventilated disc
Ventilated brake disc improves cooling capabilities and improves friction material life to minimize downtime and maintenance costs.

Ease of maintenance
Friction pads can be easily replaced without disturbing caliper mounting. The friction pads

Airflex By Danfoss Type 200DPA Caliper

Section H

The Danfoss Airflex Type 200DPA is a symmetrical opposed piston caliper brake design that is well suited for most high torque, high energy stopping applications.

Engineered for hydraulic actuation, the Airflex by Danfoss 200DPA is a robust design able to withstand the tough operating conditions associated with industrial applications. Standard fea-Tures include

- A large piston area and 2000 psi operating pressure range . give high frictional force resulting in more torque
- Base or split mounting for flexibility of mounting and accommodation of different disc thicknesses or diameters to meet diverse customer requirements
- Guide pins transmit torque from friction shoes which prevents piston seal leakage that could result from misalignment between the friction shoe and disc
- Large friction area for long life and reduced maintenance due to friction material wear
- Automatic friction shoe wear adjustment with each engagement
- Solid or ventilated discs to optimize performance and lining life

Common Applications

- Conveyors
- Flywheel brakes
- Inertia brakes
- Mining Equipment
- Parking brakes
- Rotary brakes
- Tension brakes
- Top Drive brakes
- Wind Turbine brakes

Why the Airflex by Danfoss 200DPA

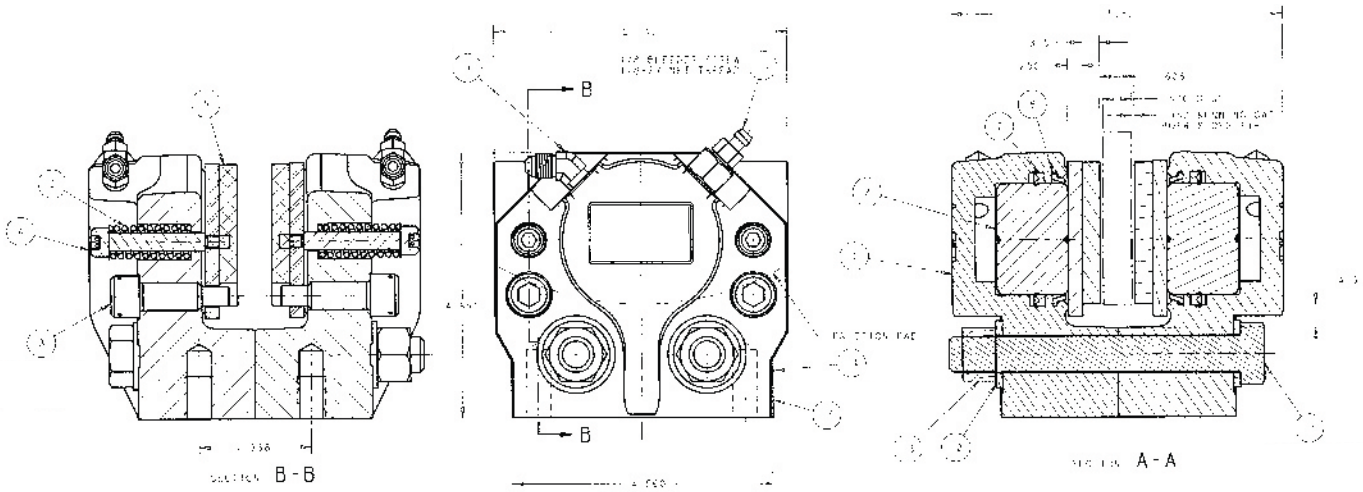

- High quality
- High performance
- Low cost of ownership
- Low maintenance
- Long lining life

Air Over Hydraulic Intensifier

Section H

Description

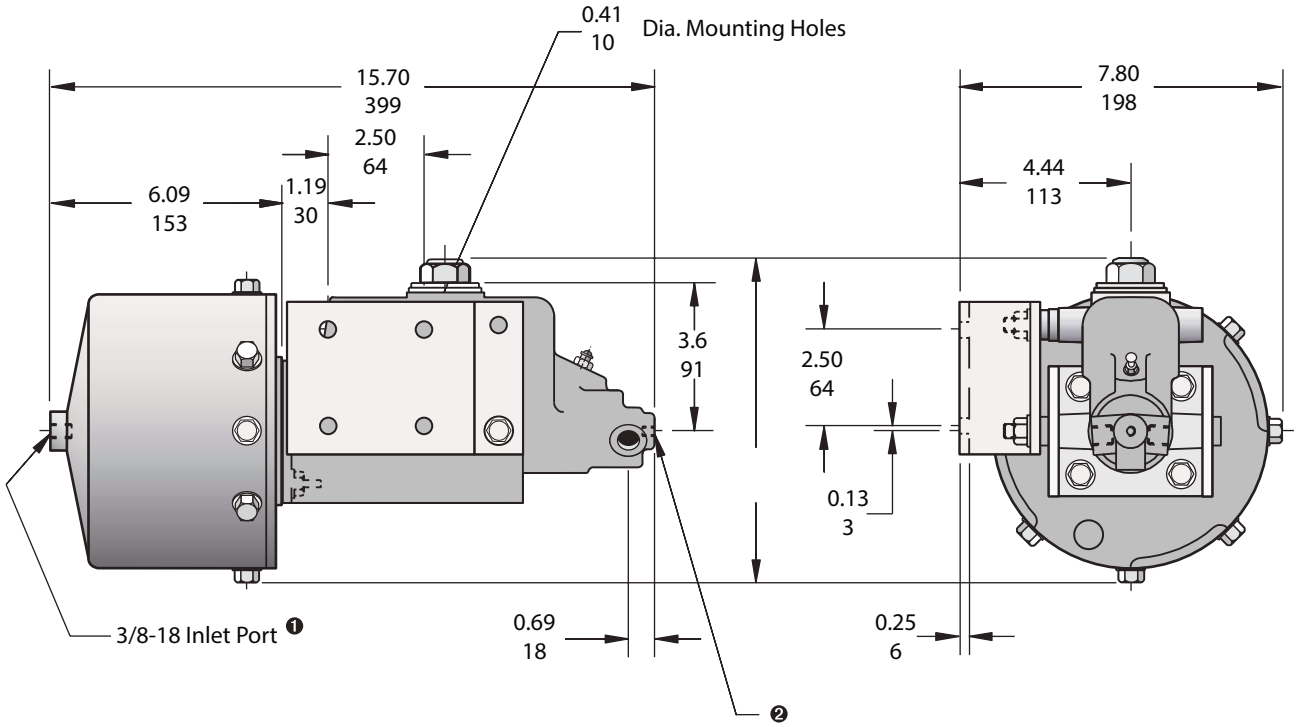

This intensifier is designed for industrial caliper brakes which require low initial hydraulic displacement prior to full pressure application and requires near zero residual system pressure. It is intendedfor single stop and low cyclic duty. It multiplies a low air pressure input into a higher hydraulic pressure output.

Contact the factory for the appropriate intensifier to meet your application requirements.

Hydraulic to air pressure ratio – 15:1

Maximum displacement – 4.7 in^3 (0,08 dm^3)

Actuating fluid – vegetable base only

Notes:

❶ American National Pipe Thread.

❷ Three 1/2-20-2B female ports. Unit includes two 1/2-20-2B plugs and two gaskets as well as one adapter fitting for 1/4-18-NPT female thread connection and gasket.

000153X0761	Hydraulic Intensifier Repair Kit

Frictional Force Adjustment

Dynamic frictional force ratings $\mathbf{F_r}$ are given for calipers furnished with either standard or low coefficient friction linings. The ratings are based upon an effective pressure $\mathbf{p_r}$ of 1000 psi (69 bar) for standard linings and 100 psi (6,9 bar) for low coefficient linings. Low coefficient linings are intended for applications which slip continuously and as a result are not recommended for use at pressures over 100 psi (6,9 bar).

Friction force ratings must be adjusted for operating pressure $\mathbf{p_o}$ and the parasitic loss $\mathbf{p_p}$ which represents the pressure to overcome piston seal friction and friction shoe release springs. The effective friction force $\mathbf{F_e}$ is calculated from:

$$F_e = \frac{p_o - p_p}{p_r} \cdot F_r$$

Torque Calculations

Braking torque is calculated from:

$$M_e = 0.5 \cdot N \cdot F_e \, (D - C_t)$$

where M_e is the effective brake torque (lb•in or N•m)

N=number of calipers

F_e = effective frictional force (lb or N)

D=disc outsidediameter(in or m)

C_t = disc constant

Parameter	225 DP 100		HC3 and HD3	
	English Units	SI Units	English Units	SI Units
Dynamic Frictional Force F_r				
Standard linings @ 1000 psi (69 bar)	2540 lb	11300 N	5300 lb	23600N
Lo-co linings @ 100 psi (6,0 bar)	190 lb	845 N	400 lb	1780 N
Static Friction Force				
Standard linings @ 1000 psi (69 bar)	3170 lb	14100N	6620 lb	29440 N
Parasitic Loss p_p	8 psi	0,6 bar	10 psi	0,7 bar
Disc Constants				
C_d	8.25	2095	10.21	2593
C_t	3.2	0,08	4.1	0,10
Minimum Disc Diameter	9.63 in.	0,24 m	18.63 in	0,47 m
Friction Area	12.5 in^2	80 cm^2	39 in^2	252 cm^2
Typical Disc Running Clearance per Side	0.03 in	0,8 mm	0.06 in	1,6mm
Displacement to Engagement	0.5 in^3	0,008 dm^3	1.1 in^3	0,018 dm^3
Cylinder Volume - Engaged				
New lining and disc	0.9 in^3	0,015 dm^3	3.5 in^3	0,06 dm^3
Worn lining and disc	4.0 in^3	0,07 dm^3	12.5 in^3	0,21 dm^3
Lining Thickness				
New	0.65 in	17 mm	0.56 in	14 mm
Worn	0.37 in	9 mm	0.06 in	1,5 mm
Weight/Mass	17 lb	7,7 kg	85 lb	39 kg

Example

What combinations of disc diameters and number of 225DP100 calipers will produce a dynamic torque of 5000 lb•in. Air pressure of 80 psi is available.

$$Fe = \frac{p_o - p_p}{p_r} \cdot Fr$$

$$= \frac{80 - 8}{1000} \cdot 2540$$

$$= 183 \text{ lb}$$

$$Me = 0.5 \cdot N \cdot F_e \, (D - C_t)$$

$$D = \frac{M_e}{0.5 \cdot N \cdot F_e} + C_t$$

$$= \frac{5000}{0.5 \cdot 183 \cdot N} + 3.2$$

$$= \frac{54 \cdot 64}{N} + 3.2$$

No. Calipers N	Disc Diameter (in)
One	58
Two	30.5
Three	21.5
Four	17

Thermal Capacity

Non-cyclic thermal capacity is determined by the caliper's friction area and/or the swept area of the braking disc. For good life, it is recommended that the peak thermal power not exceed 75 HP (56 kW) for the 225DP100 and 235 HP (175 kW) for the HC3 and HD3 calipers. Disc swept area loading should not exceed 0.3 HP/in^2 (0.035 kW/cm^2). The swept area can be approximated from:

$$A_s = Cd \cdot (D - Ct)$$

where A_s = disc swept area in^2 (cm^2)

C_d = disc constant

D = disc outside diameter in (m)

C_t = disc constant

The following graph illustrates the continous thermal power dissipation for the 225DP100 caliper with low coefficient friction linings and a 15 inch (0.38 m) diameter ventilated disc.

Example

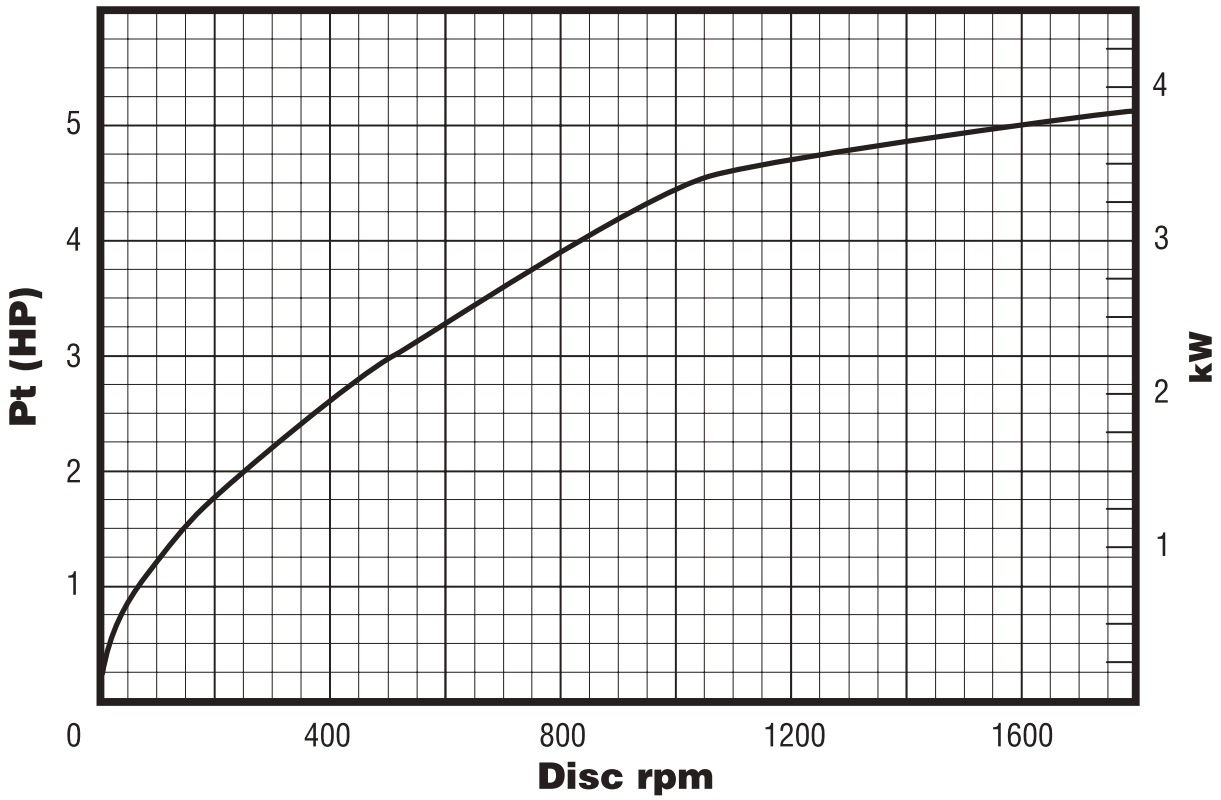

A 1,5 m diameter disc will be used with a HC3 caliper.

What is the disc's thermal capacity?

$$A_S = C_d \cdot (D\text{-}C_1)$$

$$= 2593 \cdot (1{,}5 - 0{,}10)$$

$$= 3630 \ \frac{kW}{cm^2} \cdot 3630 \ cm^2 = 127$$

Danfoss Power Solutions is a global manufacturer and supplier of high-quality hydraulic and electric components. We specialize in providing state-of-the-art technology and solutions that excel in the harsh operating conditions of the mobile off-highway market as well as the marine sector. Building on our extensive applications expertise, we work closely with you to ensure exceptional performance for a broad range of applications. We help you and other customers around the world speed up system development, reduce costs and bring vehicles and vessels to market faster.

Danfoss Power Solutions – your strongest partner in mobile hydraulics and mobile electrification.

Go to www.danfoss.com for further product information.

We offer you expert worldwide support for ensuring the best possible solutions for outstanding performance. And with an extensive network of Global Service Partners, we also provide you with comprehensive global service for all of our components.
